Ripple and Noise

100 to 150 mV_{p-p}, typical (max. 1% of nominal voltage) measured across a 1 μ F ceramic capacitor.

Transient Over-and-undershoot

Voltage change less than 10% of nominal value for load step from 50% to 100%. Return to regulation in under 1 ms.

Turn on Transient

No Voltage overshoot during turn on.

Protections *

Input

- **Inrush Current Limiter**
Up to 6 times the maximum input current for less than 50 μ s.

Output

- **Over-voltage Protection**
Passive transorb on output, 120% $\pm$ 10% of nominal voltage.
- **Current limiting**
Continuous protection (10 to 30% above maximum current) for unlimited time.

General

- **Over temperature protection**
Shutdown at baseplate temperature of $+105^\circ\text{C} \pm 5^\circ\text{C}$. Automatic recovery at base plate temperature lower than $+95^\circ\text{C} \pm 5^\circ\text{C}$.

* Thresholds and protections can be modified / removed – please consult factory.

Functions and Signals

INHIBIT

The **INHIBIT** signal is used to turn the power supply ON and OFF. OPEN – will turn on the power supply.
SHORT – between pin 14 and pin 1 will turn off the power supply. This signal is referenced to the **SIGNAL RTN** pin.

SENSE

The SENSE is used to achieve accurate load regulations at load terminals (this is done by connecting the pins directly to the load's terminals).

The use of remote sense has a limit of voltage dropout between converter's output and load terminals of 2-10% of voltage output (up to 2V).

Please note that if Sense lines are not used the output may rise as much as 2V above nominal outputs. If sense lines are not to be used in the application, please inform factory for internal connection to output pins.
